Many commentaries on the Apocalypse were produced in the early Middle Ages. This book provides translations of two Apocalypse commentaries from the seventh and eighth centuries. On the Mysteries of the Apocalypse of John is part of a large one-volume "Reference Bible" composed about 750. Written probably by an Irish teacher residing in northern France, it answers difficulties arising from the biblical text. The Handbook on the Apocalypse of the Apostle John, attributed erroneously to Jerome and written before 767, contains brief moral and allegorical interpretations of particular words and phrases of the Apocalypse. The introduction highlights the unique features of each commentary and the interrelationship of the three texts.

Number Theory Revealed: A Masterclass acquaints enthusiastic students with the "Queen of Mathematics". The text offers a fresh take on congruences, power residues, quadratic residues, primes, and Diophantine equations and presents hot topics like cryptography, factoring, and primality testing. Students are also introduced to beautiful enlightening questions like the structure of Pascal's triangle mod  $p$  and modern twists

on traditional questions like the values represented by binary quadratic forms, the anatomy of integers, and elliptic curves. This Masterclass edition contains many additional chapters and appendices not found in Number Theory Revealed: An Introduction, highlighting beautiful developments and inspiring other subjects in mathematics (like algebra). This allows instructors to tailor a course suited to their own (and their students') interests.

There are new yet accessible topics like the curvature of circles in a tiling of a circle by circles, the latest discoveries on gaps between primes, a new proof of Mordell's Theorem for congruent elliptic curves, and a discussion of the abc-conjecture including its proof for polynomials. About the Author: Andrew Granville is the Canada Research Chair in Number Theory at the University of Montreal and professor of mathematics at University College London. He has won several international writing prizes for exposition in mathematics, including the 2008 Chauvenet Prize and the 2019 Halmos-Ford Prize, and is the author of Prime Suspects (Princeton University Press, 2019), a beautifully illustrated graphic novel murder mystery that explores surprising connections between the anatomies of integers and of permutations.

One stormy night, five stranded schoolchildren uncover the story of Richard Clayton Harwick – a boy who many years ago learned what it was like to have a truly wicked stepfather. But the children have stories of their own step-parents to tell – stories that have warmth and humour, as well as sadness, and a fair share of happy endings. 'For children who have some similar experience, this novel will be therapeutic; for those who haven't it's an absorbing read, to make them laugh and cry' Sunday Telegraph.

High Performance Computing (HPC) is the area of supercomputers, the fastest and best systems of their time. Most supercomputers are used to solve scientific problems, be it weather forecasting or simulation of car crashes. This book deals with systems that are in practical use for such application areas. It details the history of supercomputers and highlights the properties and trends that will remain in the future. Coverage also describes all aspects of High Performance Computing, explores the practice of HPC planning, and offers a look at current trends and visions, like Grid Computing.

Developing and Leading Emergence Teams describes a future business landscape that seems to be complicated, complex and chaotic, in almost equal measures. The variety and diversity of the environments within which large organizations will be seeking to operate, require a similar variety of systems, process and structures if they are to respond successfully to emerging opportunities. The established models of teamworking (matrix, cross-functional or transdisciplinary) can all adapt to this new environment but will only do so if the culture, leadership and management style of the business enables this. The authors describe a model of emergence teams; high-trust teams that exhibit exceptional affinity for knowledge sharing, sense making, and consensus building. They then explore the specifics of leading such a team, how the team leader should: design the team; interact and facilitate the team's development; understand the personal nature of each of the team members and the overall emotional regime that will affect trust, commitment and motivation. Peter Smith and Tom Cockburn draw on research and detailed case examples to provide techniques your organization can adopt in order to build and support the various teams capable of addressing complexity.

Counselling for Managers takes a sympathetic, practical and very honest look at workplace counselling. All managers find themselves counselling occasionally, yet few receive training in this very demanding aspect of managing people. And when the need arises, the skills need to be there already - preparation time is not an option.

This book gives a treatment of exterior differential systems. It will include both the general theory and various applications. An exterior differential system is a system of equations on a manifold defined by equating to zero a number of exterior differential forms. When all the forms are linear, it is called a Pfaffian system. Our object is to study its integral manifolds, i. e. , submanifolds satisfying all the equations of the system. A fundamental fact is that every equation implies the one obtained by exterior differentiation, so that the complete set of equations associated to an exterior differential system constitutes a differential ideal in the algebra of all smooth forms. Thus the theory is coordinate-free and computations typically have an algebraic character; however, even when coordinates are used in intermediate steps, the use of exterior algebra helps to efficiently guide the computations, and as a consequence the treatment adapts well to geometrical and physical problems. A system of partial differential equations, with any number of independent and dependent variables and involving partial derivatives of any order, can be written as an exterior differential system. In this case we are interested in integral manifolds on which certain coordinates remain independent. The corresponding notion in exterior differential systems is the independence condition: certain Pfaffian forms remain linearly independent. Partial differential equations and exterior differential systems with an independence condition are essentially the same object.

From Thomas Jefferson to John Rawls, justice has been at the center of America's self-image and national creed. At the same time, for many of its peoples—from African slaves and European immigrants to women and the poor—the American experience has been defined by injustice: oppression, disenfranchisement, violence, and prejudice. In *Identity and the Failure of America*, John Michael explores the contradictions between a mythic national identity promising justice to all and the realities of a divided, hierarchical, and frequently iniquitous history and social order. Through a series of insightful readings, Michael analyzes such cultural moments as the epic dramatization of the tension between individual ambition and communal complicity in *Moby-Dick*, "attempts to effect social change through sympathy in the novels of Lydia Marie Child and Harriet Beecher Stowe, Ralph

Waldo Emerson's antislavery activism and Frederick Douglass's long fight for racial equity, and the divisive figures of John Brown and Nat Turner in American letters and memory. Focusing on exemplary instances when the nature of the United States as an essentially conflicted nation turned to force, Michael ultimately posits the development of a more cosmopolitan American identity, one that is more fully and justly imagined in response to the nation's ethical failings at home and abroad. John Michael is professor of English and of visual and cultural studies at the University of Rochester. He is the author of *Anxious Intellectuals: Academic Professionals, Public Intellectuals, and Enlightenment Values* and *Emerson and Skepticism: The Cipher of the World*."

to the English Translation This is a concise guide to basic sections of modern functional analysis. Included are such topics as the principles of Banach and Hilbert spaces, the theory of multinormed and uniform spaces, the Riesz-Dunford holomorphic functional calculus, the Fredholm index theory, convex analysis and duality theory for locally convex spaces. With standard provisos the presentation is self-contained, exposing about a hundred famous "named" theorems furnished with complete proofs and culminating in the Gelfand-Naimark-Segal construction for  $C^*$ -algebras. The first Russian edition was printed by the Siberian Division of "Nauka" Publishers in 1983. Since then the monograph has served as the standard textbook on functional analysis at the University of Novosibirsk. This volume is translated from the second Russian edition printed by the Sobolev Institute of Mathematics of the Siberian Division of the Russian Academy of Sciences in 1995. It incorporates new sections on Radon measures, the Schwartz spaces of distributions, and a supplementary list of theoretical exercises and problems. This edition was typeset using AMS-TEX, the American Mathematical Society's TEX system. To clear my conscience completely, I also confess that := stands for the definor, the assignment operator, signifies the end of the proof.

This book is about the role and potential of using digital technology in designing teaching and learning tasks in the mathematics classroom. Digital technology has opened up different new educational spaces for the mathematics classroom in the past few decades and, as technology is constantly evolving, novel ideas and approaches are brewing to enrich these spaces with diverse didactical flavors. A key issue is always how technology can, or cannot, play epistemic and pedagogic roles in the mathematics classroom. The main purpose of this book is to explore mathematics task design when digital technology is part of the teaching and learning environment. What features of the technology used can be capitalized upon to design tasks that transform learners' experiential knowledge, gained from using the technology, into conceptual mathematical knowledge? When do digital environments actually bring an essential (educationally, speaking) new dimension to classroom activities? What are some pragmatic and semiotic values of the technology used? These are some of the concerns addressed in the book by expert scholars in this area of research in mathematics education. This volume is the first devoted entirely to issues on designing mathematical tasks in digital teaching and learning environments, outlining different current research scenarios.

Astatine is - besides radon and francium - the only natural radioelement which only has short-lived isotopes, thereby excluding experiments with . . weighable" amounts of the element. This implies that all available data on physics and chemistry of this element are 12 16 based on experiments on the tracer scale with 10- to 10- g - and this will also not change in future because no longer-lived isotopes as yet known are to be expected. Due to the fact that the only isotope of At occurring in the natural decay series,  $^{219}\text{At}$ , results from the 0. 005%  $\alpha$ -branching of  $^{223}\text{Fr}$  which itself is produced by the only 1. 38%  $\alpha$ -branching of  $^{227}\text{Ac}$  - a member of the  $^{235}\text{U}$  series - there is no chance to recover substantial amounts of  $^{219}\text{At}$  from natural

sources for scientific research of At. All studies, therefore, are being done with the isotopes  $^{209}\text{At}$  to  $^{211}\text{At}$  having half-lives in the few hours region and being obtained by irradiation of bismuth with  $\alpha$ -particles via  $(\alpha, xn)$  reactions or by proton irradiation of heavy elements via spallation reactions. The mostly used isotope is 7. 22 h  $^{211}\text{At}$ . The fast separation of the obtained At isotopes is no very difficult procedure and is either being done by wet adsorption-precipitation techniques or making use of its high volatility by distilling in air.
