AGUIRRE DUDLEY

Boletín bibliográfico mexicano EUNED

This advanced textbook on linear algebra and geometry covers a wide range of classical and modern topics. Differing from existing textbooks in approach, the work illustrates the many-sided applications and connections of linear algebra with functional analysis, quantum mechanics and algebraic and

differential geometry. The subjects covered in some detail include normed linear spaces, functions of linear operators, the basic structures of quantum mechanics and an introduction to linear programming. Also discussed are Kahler's metric, the theory of Hilbert polynomials, and projective and affine geometries. Unusual in its extensive use of applications in physics to clarify each topic, this comprehensive volume should be of particular interest to advanced undergraduates and graduates in

mathematics and physics, and to lecturers in linear and multilinear algebra, linear programming and quantum mechanics.
