In a solution (or dissolved) gas drive reservoir, the oil-bearing

rock is completely surrounded by impermeable barriers. As the reservoir pressure drops during production, expansion of the oil and its dissolved gas provides most of the reservoir's drive energy . Additional energy is obtained from the expansion of the rock and its associated water. Drive mechanisms and recovery - AAPG Wiki Gas reservoir engineering is the branch of reservoir engineering that deals exclusively with reservoirs of non-associated gas. The prime purpose of reservoir engineering is the formulation of development and production plans that will result in maximum recovery for a given set of economic, environmental and technical constraints. The Big Butte Field is a solution gas-drive reservoir that is under consideration for a waterflood project. The volumetric calculations of the field indicate that the areal extent of the field is 1612.6 acres. The field is characterized by the following properties:

Thickness $h = 25$ ft
 Porosity $\phi = 15\%$
 Initial water saturation $S_{wi} = 20\%$
