"For someone interested in practical present day robotics it's a treasure trove. A

book-sized Top Trumps rove across the technical domain, with each section containing a photo of the precise robot, an overview of its main components and some context for its aims and purposes." - Electronics Weekly

Robots exist all around us. They populate our factories, assist our surgeons and have become an integral part of our armed forces. But they are not just working behind the scenes - impressive inventions such as free-roaming hoovers take care of your household chores and the iPal is set to become your closest friend. David Hambling reveals the groundbreaking machines - once the realm of science fiction - that are by our sides today, and those that are set to change the future forever. From the Reem robocop that polices the streets of Dubai to the drones that deliver our parcels and even the uncanny Gemonoid Hi-4 built to look just like you, here are fifty unique robots

that reach into every aspect of our daily lives. *We:Robot* examines why robots have become embedded in our culture, how they work and what they tell us about our society and its future.

What is the relation between politics and the world? It might seem that global capitalism has created one world, but this is an illusion because capitalism creates a world of objects and money that divides human existence into regions separated by fences and walls built to keep some people out. In place of this falsely unified world of global capitalism, we need to assert a fundamental principle – namely, that there is one world of living subjects. This, in

Badiou's view, is the categorical imperative of all true politics. The one world of living subjects is the place where an infinity of differences and identities exist. Hence foreigners are not a problem but rather an opportunity and a gift. They bear witness to the youth of the world in its infinite variety, and it is with this youth that the politics of the future rests.

Foreignness is the means by which existence is re-evaluated, and all true politics is a new dawn of existence. This collection of essays by Badiou, in which he draws out the political implications of recent events and social movements, will be of value to anyone interested in the great social and political

questions of our time.

From bestselling and award-winning author and illustrator Peter Brown comes a heartwarming and action-packed novel about what happens when nature and technology collide. *Biology-Inspired Engineering and Engineering-Inspired Biology* Oxford University Press How to develop robots that will be more like humans and less like computers, more social than machine-like, and more playful and less programmed. Most robots are not very

friendly. They vacuum the rug, mow the lawn, dispose of bombs, even perform surgery—but they aren't good conversationalists. It's difficult to make eye contact. If the future promises more human-robot collaboration in both work and play, wouldn't it be better if the robots were less mechanical and more social? In *How to Grow a Robot*, Mark Lee explores how robots can be more human-like, friendly, and engaging. Developments in artificial intelligence—notably Deep Learning—are widely seen as the foundation on which our robot future will be built. These advances have already brought us self-driving cars and chess match-winning algorithms. But, Lee

writes, we need robots that are perceptive, animated, and responsive—more like humans and less like computers, more social than machine-like, and more playful and less programmed. The way to achieve this, he argues, is to “grow” a robot so that it learns from experience—just as infants do. After describing “what's wrong with artificial intelligence” (one key shortcoming: it's not embodied), Lee presents a different approach to building human-like robots: developmental robotics, inspired by developmental psychology and its accounts of early infant behavior. He describes his own experiments with the iCub humanoid robot and its development from

newborn helplessness to ability levels equal to a nine-month-old, explaining how the iCub learns from its own experiences. All robots are designed to know humans as objects; developmental robots will learn empathy.

Developmental robots, with an internal model of “self,” will be better interactive partners with humans. That is the kind of future technology we should work toward.

'The internet is made of cats' is a half-jokingly made claim. Today, animals of all shapes and sizes inhabit our digital spaces, including companion animals, wildlife, feral animals and livestock. In this book, Deborah Lupton explores how digital technologies and datafication are changing our relationships with other animals. Playfully building on the concept of 'The Internet of Things', she discusses the complex feelings that have developed between people and animals through the use of digital devices, from social media to employing animal-like

robots as companions and carers. The book brings together a range of perspectives, including those of sociology, cultural geography, environmental humanities, critical animal studies and internet studies, to consider how these new digital technologies are contributing to major changes in human-animal relationships at both the micropolitical and macropolitical levels. As Lupton shows, while digital devices and media have strengthened people's relationships to other creatures, these technologies can also objectify animals as things for human entertainment, therapy or economic exploitation. This

original and engaging book will be of interest to scholars and students across the social sciences and humanities.

Examining the potential benefits and risks of using artificial intelligence to advance global sustainability. Drones with night vision are tracking elephant and rhino poachers in African wildlife parks and sanctuaries; smart submersibles are saving coral from carnivorous starfish on Australia's Great Barrier Reef; recycled cell phones alert Brazilian forest rangers to the sound of illegal logging. The tools of artificial intelligence are being increasingly deployed in the battle for global

sustainability. And yet, warns Peter Dauvergne, we should be cautious in declaring AI the planet's savior. In *AI in the Wild*, Dauvergne avoids the AI industry-powered hype and offers a critical view, exploring both the potential benefits and risks of using artificial intelligence to advance global sustainability. Dauvergne finds that corporations and states often use AI in ways that are antithetical to sustainability. The competition to profit from AI is entrenching technocratic management, revving up resource extraction, and turbocharging consumption, as consumers buy new smart devices (and discard their old, less-smart ones). Smart technology is helping

farmers grow crops more efficiently, but also empowering the agrifood industry. Moreover, states are weaponizing AI to control citizens, suppress dissent, and aim cyberattacks at rival states. Is there a way to harness the power of AI for environmental and social good?

Dauvergne argues for precaution and humility as guiding principles in the deployment of AI.
