Becoming an Outstanding Languages Teacher explores the skills that it takes to deliver exceptional language teaching and produce outstanding results. Written by a highly experienced teacher and teacher educator, this book provides a wide range of approaches to teaching, along with an abundance of practical classroom ideas. This new edition keeps the focus on the nuts and bolts of planning lessons - which will keep students engaged and stimulated when learning a language - and features a new chapter on intercultural understanding, as well as updated information on the latest digital technology tools. Reference is made to tried and tested methodologies and classroom procedures, along with exciting new approaches which teachers have found productive. The book covers: how to run a room; dissecting lessons: written texts, aural texts and visuals; teacher-student interactions, communicative tasks and sentence-building; developing phonological and phonics skill; purposeful games; teaching with words and chunks;

teaching students with varying aptitude for language learning; using digital technology to support learning; what it means to "teach grammar"; intercultural understanding; building a repertoire to lighten your workload. Packed full of strategies which are easy to implement, this book is essential reading for both pre-service teachers and experienced practitioners.

 Humans evolved in the dynamic landscapes of Africa under conditions of pronounced climatic, geological and environmental change during the past 7 million years. This book brings together detailed records of the paleontological and archaeological sites in Africa that provide the basic evidence for understanding the environments in which we evolved. Chapters cover specific sites, with comprehensive accounts of their geology, paleontology, paleobotany, and their ecological significance for our evolution. Other chapters provide important regional syntheses of past ecological conditions. This book is unique in merging a broad geographic scope (all of Africa) and deep time framework (the past 7 million years) in discussing the geological context and paleontological records of our evolution and that of organisms that evolved alongside our

ancestors. It will offer important insights to anyone interested in human evolution, including researchers and graduate students in paleontology, archaeology, anthropology and geology.

The Mini, the car of the 20th Century and still in motorsport in 1997, 35 years after its 1st event. This is its story. In the 60s the BMC works teams using Mini s were virtually unstoppable in their quest for recognition in the big world of rallying, they succeeded where others had failed and the BMC works teams were at the time probably the envy of the motorsport world. They introduced to the enthusiast the Special Tuning or ST as it was later known, a range of tuning products that the public could buy and fit to their own cars thus using the very same parts that the works team were using. Sadly the competition department was wound down and the ST finally went the same way in 1980. Imagine the excitement that hit the media when in the Autumn of 1993 Rover officially announced that they would fund the build of several cars to once again campaign the world famous Rallye Monte Carlo. Although they were not works cars, the large contribution of materials and money to the project it was regarded as tantamount to funding a works team, especially when Paddy Hopkirk was named as one of the drivers. It was this that started 4 years of Works backed mini s to varying degrees, culminating in 1996 to a full works backed team of 2 cars and a full campaign of rallies and races for the three years. Typically the Mini of the 90 s, similarly to the Mini of the 60 s, carried with it a fair degree of controversy. Over the next four years there was plenty of it, with money being diverted by the sponsor from one team to another, one car even being stolen and top rallying stars carrying out secret test sessions, being just a few examples. All of this using cars that were designed way back in the 50 s and even still using the same basic design of engine and gearbox against competitors who were using cars designed over thirty years later with modern engines and transmissions. This book highlights how the use of fuel injection, distributor-less ignition, six speed gearboxes and modern tyres all helped to bring the mighty mini once again to the foreground of modern rallying and racing. In 1996 the ST range of competition parts was re-introduced, with the parts coming from the latest 1996 build of works cars but once again in mid 1997 the project was pulled amid secrecy, sackings and bitter recriminations that even to this day have prevented the authors from being able to speak to those that were involved behind the scenes at the end of the line for the Last Works Minis . With many unseen photos of the cars development, copies of Rovers internal documents, copy pages from the road books of top rallies, all of this in colour this book truly brings this previously untold story to life.

In geography, a region is one of the most obscure and controversial scientific research objects. However, the tourism sector frequently uses the term, both in the communication of tourism destinations and in daily-life vocabulary, to characterize spatial practices that overtake the scale of a place. That said, a geographic concentration of place, equipment and accommodation does not equate to a tourist region. In order to define the tourist region, this book presents the common thoughts and interpretations of it, which have been advanced by geographers since the beginning of the 20th Century. The Tourist Region also examines stakeholders' logics that are identified in the practices of a tourist destination in a regional dimension, and explores the tourist region as a territorial co-construction. Finally, this book analyzes multi-level regional networks of tourist

places, built according to tourist mobilities. By presenting several measurement methods of the tourist region, this book explains the spatial practices of tourists and anticipates the actions for tourism professionals.

The Channel Tunnel has been called the greatest engineering project of the century, overcoming a unique set of financial, political and engineering challenges. This book provides a comprehensive insight into the events which culminated in the first dry link between Britain and France. It describes the relationship between the site investigation, data interpretation and construction of the works. It examines areas such as the difficulties inherent in predicting geology from a relatively small number of boreholes and revealing how the use of modern geophysical techniques.

The increasing demand for rural land and its natural resources is creating competition and conflicts. Many interested parties, including farmers, nature conservationists, rural residents and tourists, compete for the same space. Especially in densely populated areas, agriculture, recreation, urban and suburban growth and infrastructure development exert a constant pressure on rural areas. Because land is a finite resource, spatial policies which are formulated and implemented to increase the area allocated to one use imply a decrease in land available for other uses. As a result, at many locations, multi-purpose land use is becoming increasingly important. This notion of multi-purpose land use is reflected in the term 'multifunctionality'. This volume provides insights into viable strategies of sustainable management practices allowing multiple functions sustained by agriculture and natural resources in rural areas. It shows how the rural economy and policies can balance and cope with these competing demands and includes numerous case studies from Europe, North America and developing countries.

Radiations, or Evolution in Action We have just celebrated the "Darwin Year" with the double anniversary of his 200th birthday and 150th year of his masterpiece, "On the Origin of Species by means of Natural Selection". In this work, Darwin established the factual evidence of biological evolution, that species change over time, and that new organisms arise by the splitting of ancestral forms into two or more descendant species. However, above all, Darwin provided the mechanisms by arguing convincingly that it is by natural selection - as well as by sexual selection (as he later added) - that organisms adapt to their environment. The many discoveries since then have essentially confirmed and strengthened Darwin's central theses, with latest evidence, for example, from molecular genetics, revealing the evolutionary relationships of all life forms through one shared history of descent from a common ancestor. We have also come a long way to progressively understand more on how new species actually originate, i. e. on speciation which remained Darwin's "mystery of m-teries", as noted in one of his earliest transmutation notebooks. Since speciation is the underlying mechanism for radiations, it is the ultimate causation for the biological diversity of life that surrounds us.

Coastal and estuarine environments at the interface of terrestrial and marine areas are among the most productive in the world. However, since the beginning of the industrial era, these ecosystems have been subjected to strong anthropogenic pressures intensified from the second half of the 20th century, when there was a marked acceleration in the warming (climate change) of the continents, particularly at high latitudes. Coastal ecosystems are highly vulnerable to alteration of their physical, chemical and biological characteristics (marine intrusion, acidification of marine environments, changes in ecosystems, evolution and artificialization of the coastline, etc.). In contact with heavily populated areas, these environments are often the receptacle of a lot of chemical and biological pollution sources that significantly diminish their resilience. In this context of accelerated evolution and degradation of these areas important for food security of many populations around the world, it is necessary to better identify the factors of pressure and understand, at different scales of observation, their effects and impacts on the biodiversity and on the socio-eco-systems, in order to determine the degree of vulnerability of these coastal ecosystems and the risks they face. A transdisciplinary and integrated approach is required to prevent risks. Within this framework, operational coastal oceanography occupies an important place but also the implementation of a true socio-eco-system approach in order to set up an environmentally friendly development.

Afoot and Afield: Denver, Boulder, Fort Collins, and Rocky Mountain National Park is one of the most comprehensive hiking and biking books available. Alan Apt, author of the best-selling guidebook, Snowshoe Routes Colorado's Front Range, carefully describes 170 adventures for people of all abilities and interests. He includes everything from easy access Front Range lakeside strolls, to high mountaineering peak climbs. The book even includes sections called, Great for Kids (of all ages); that are less ambitious but highly satisfying, easy gambols in the natural world. The geographical scope of the book stretches from southern Wyoming to Colorado Springs, and west to Vail, Fairplay, and Independence Pass; with superb coverage of mountains, plains, canyons and riverside adventures. The books includes over 150 photos, and maps for every trail, as well as safety checklists, and how-to tips based on more than 40 years of outdoor experience.

'Living on the Edge' examines the function of the Sahel region of Africa as an important wintering area for long-distance migrant birds. It describes the challenges the birds have to cope with - climate change, of course, and rapid man-made habitat changes related to deforestation, irrigation and reclamation of wetlands. How have all these changes affected the birds, and have birds adapted to these changes? Can we explain the changing numbers of breeding birds in Europe by changes in the Sahel, or vice versa?

This book provides an up-to-date account of the many processes shaping and transforming rural space in various parts of the world. The various case studies focus on the multi-functionality of the rural world and the driving forces behind it. The book demonstrates that rural areas are no longer simply characterized by an agricultural economy, and instead accommodate multiple complementary activities. It also touches upon two major changes that have taken place. The first is the process of ruralization, which has led to the clear distinction between town and countryside becoming blurred: urban traits have penetrated rural areas, and rural traits have invaded towns. The second change is that rural areas are increasingly seen as multi-functional, providers not only of food and other natural resources but also locations for the generation of renewable energy (wind farms, solar farms, biogas) and regions for the preservation of biodiversity. These transformations have resulted in a new understanding and self-image of rural areas and their populations.

Geographical Offender Profiling (GOP) is the term that has emerged for the examination of where offences take place and the use of that examination to formulate views on the nature of the offender and where s/he might be based. As such, it has become the cornerstone of 'offender profiling'. By its nature, GOP bridges psychology, geography, criminology and forensic science and is of academic interest to all those disciplines as well as practical significance to police investigators. This book brings together a cross-section of the major papers published in the field that lay out the concepts and foundations of this area - including some widely quoted but difficult to obtain 'classic' papers - with an introduction that puts the papers into an overall context and a concluding extensive bibliography of the publications relevant to this rapidly growing area.

Since 1971, UNESCO's Man and the Biosphere (MAB) Programme has embraced a number of

principles that link the political, scientific and academic spheres. Biosphere Reserves and Sustainable Development Goals 2 is a reminder of the fundamental issues involved in governance. The diversity and multiplicity of stakeholders, and the complexity of the interplay between them, as well as their organization, are decisive factors in the proper management of resources and

territories. The book also presents a number of case studies demonstrating that, between the strong development aspirations of their populations, the impact of human activities and the need to conserve their biological heritage, the biosphere reserves of the southern Mediterranean are facing major issues: agricultural pollution, forest fires, water use in a context of climate change, etc.
