In recent times, both primary authors have observed that to establish a thorough and effective training program, orthopaedic trainees should undertake intensive study of orthopaedic textbooks. This should be complemented by daily practical application involving the use of questions, including both multiple-choice questions (MCQs) and short-answer questions (SAQs), along with their corresponding solutions. This recognition marked the initial phase of developing and composing a book

centered around orthopaedic questions. We envisage that this publication will function as a valuable companion for each orthopaedic trainee, providing prompt access to crucial knowledge and encouraging further study. The current volume, identified as Part I, encompasses all relevant information that an orthopaedic trainee needs to adequately prepare a patient for surgery. A subsequent section, Part II, will delve into knowledge related to regional orthopaedics.

The book presents a problem-based, rational approach to the diagnosis of orthopaedic problems in children. It is divided into four sections based on the age at which specific problems may be encountered; the newborn and infant, the toddler and the pre-school child, the child in the school-going age and the adolescent. The authors outline a systematic approach to arrive at a tentative diagnosis by asking relevant questions related to the presenting symptom and then performing a thorough clinical examination. They then suggest the most appropriate investigations to confirm the diagnosis. Each chapter deals with the common conditions that may lead to the problem; the rarer causes of the problem are listed at the end. This feature would make the book a practical manual and a high quality reference source. An important feature of the book is the number and quality of illustrations and video clips in the electronic version.
