With the increased interest in climate impacts, sustainability, and efficiency, more responsibility is being placed on boiler operators to help improve performance and reduce emissions. This third edition of the Boiler Operator's Handbook is intended to help such operators in the quest for improved operability and performance of their boilers and their plants. The theme of this book is to "operate wisely". The goal is to instill not only "know how" but "know why". The main details have been provided by the original author, Mr. Ken Heselton. This updated version has been somewhat expanded to include a wider range of examples and some of the more recent environmental requirements. To illustrate these points, topics

include multi boiler operations, understanding the plant load, maintenance issues, and controls. Every plant is different. However, it is hoped that with the information provided in this book, the wise operator will be able to address the various unique issues posed by the specific plant and provide timely solutions to meet the present-day requirements.

The problem of salinity in reclaimed water is growing as more utilities choose to use reclaimed water for irrigation and other purposes. This project is the first comprehensive look at this problem on a national level. The project conducted literature reviews on the sources of salinity to municipal wastewater and on constraints to using reclaimed water,

conducted two surveys of utilities that reclaim water, and summarized regulations regarding reclaimed water. Salt balances were developed for sewersheds in five case study utilities integrating extensive field sampling, a household survey, and a newly developed model, Water Quality (WQ) Analyst. Finally, the net annualized cost of potential salinity mitigation practices was determined using an economics model. CD included with full Appendices.
