Definitions, Criteria, and Explanatory Notes Oxford University Press, USA

Non-thermal irreversible electroporation is a new minimally invasive surgical procedure with unique molecular selectivity attributes – in fact it may be considered the first clinical molecular surgery procedure. Non-thermal irreversible electroporation is a molecular selective mode of cell ablation that employs brief electrical fields to produce nanoscale defects in the cell membrane, which can lead to cell death, without an effect on any of the other tissue molecules. The electrical fields can be produced through contact by insertion of electrode needles

around the undesirable tissue and non-invasively by electromagnetic induction. This new addition to the medical armamentarium requires the active involvement and is of interest to clinical physicians, medical researchers, mechanical engineers, chemical engineers, electrical engineers, instrumentation designers, medical companies and many other fields and disciplines that were never exposed in their training to irreversible electroporation or to a similar concept. This edited book is designed to be a comprehensive introduction to the field of irreversible electroporation to those that were not exposed or trained in the field before and can also serve as a reference manual. Irreversible electroporation is broad and interdisciplinary. Therefore, we have made an attempt to cover every one of the various aspects of the field from an introductory basic level to state of the art.
