It has been said that Will Burtin (1908-1972) was to graphic design what Albert Einstein was to physics. Burtin pioneered important contributions to international typography and visual design. He is best known as the world leader in using design to interpret science; as a proponent of 'clean', uncluttered sans-serif typography; and for his large-scale three-dimensional models, which carried the craft and the art of display to new heights. His walk-through models included a human blood cell (1958) and brain functions (1960).

His major achievement, his clarity and ingenuity with models and graphics made complex information easy to assimilate. Early success in his native Germany brought Burtin unwelcome attention from Nazi leaders courting his services. He fled with his Jewish wife to the United States. Within months he won the prestigious contract to create the Federal Works Agency exhibit for the 1939 New York World's Fair. The wartime Office of Strategic Services drafted Burtin to create Air Force gunnery manuals, cutting recruits' training from six months to six weeks. In 1945, with the U.S. still at war, Fortune magazine lobbied to extract Burtin from the army in order to appoint him Art Director. By the late 1950s he was designing the walk-through exhibits for which he is

renowned. The first monograph on Burtin, *Design and Science* illustrates his leadership in five fields: using graphics to visualize science and information (pre-war); corporate identity (from the mid-1940s); multimedia (which he called 'Integration', from 1948); large-scale scientific visualization in 3-D (from 1958, foreshadowing computer-assisted virtual environments, i.e. CAVE-space); and, with others, promoting Helvetica in North America. Illustrations of Burtin's work that have never before been published make this invaluable book essential reading for design professionals and all those interested in design, visualization, imaging and information technology.

Nuclear medicine is an ever changing subject, and the emphasis and utility of one type of study is often abruptly supplanted by another. In this unstable environment, there is a set of circumstances that offers a basic unifying structure to the activities encountered in nuclear medicine. The pivotal importance of radio pharmaceuticals in these activities makes a thorough understanding of them paramount for all who would prescribe, dispense, or in any way utilize such materials. In this volume, the author has distilled an awesome body of literature on nuclear pharmacy into a

concise and readily understandable textbook. It is written from the viewpoint of one who not only has broad experience and knowledge in nuclear pharmacy, who daily guides and instructs a variety of students in the discipline, but who also directs a clinical nuclear medicine radiopharmacy program. In this book he has avoided the esoteric and maintained an emphasis on the practical. The approach is not encyclopedic in nature, as adequate references refer the more interested reader to appropriate sources of detailed information, but one which ensures that the students will be able to absorb the essentials of nuclear pharmacy and practice it effectively with a broad understanding of the subject. At the end of each chapter a set of questions

provokes the reader to assess the sufficiency of the knowledge gained.
